How to mount your EFI partition on macOS

Find the identifier number for your EFI partition by running: `diskutil list`

To make the said mount point, run the following:

```
sudo mkdir /Volumes/EFI
```

With that done, we can finally mount the EFI partition by running the following:

```
sudo mount -t msdos /dev/disk0s1 /Volumes/EFI
```

Replace disk0s1 with whatever identifier you have, if it is the same, leave it.

Your EFI partition should now be mounted, and you can now change whatever you need to.
